

Isla Sorna (Site B) Legacy Operations & Biosecurity Review

Internal knowledge-base artifact for demonstration use

Document ID	ING-SITEB-310
Effective date	23 February 2015
Classification	Internal - Legacy Site Restricted
Document owner	InGen Corporate Risk & Biosecurity
Status	Controlled reference copy

Purpose. Define the current governance posture for Isla Sorna (Site B), preserve the distinction between historical breeding operations and current use, and control access to legacy scientific records and field activity.

Scope. Applies to InGen scientific, security, legal and records personnel handling Site B information or proposing activity on Isla Sorna.

Dataset notice: This is a fan-made, synthetic enterprise document created for a RAG portfolio demo. Canonical names, locations and major franchise events are used as factual anchors; internal controls, document IDs, process detail and management language are original synthetic content.

1. Site status

Isla Sorna, historically designated Site B, served as InGen's former breeding and production environment for genetically recreated animals. The island is not a public resort and is not treated as a routine 2015 production facility. Historical laboratories were damaged and abandoned, and animals remained on the island outside conventional managed paddock operations.

Current designation: Legacy / restricted biological site. Any proposed field activity requires exception approval and a specific operational objective.

2. Governance rules

- No routine breeding, guest operations or standard employee travel is authorized on Site B.
- Scientific interest alone is insufficient justification for a field mission; the requesting function must define the evidence needed and why records or remote methods are insufficient.
- Any on-island activity requires Security, Scientific and Corporate Risk approval.
- Legacy records must preserve uncertainty. Missing production data may not be reconstructed as fact unless the basis is explicitly identified.
- Site B evidence must not be merged silently with Isla Nublar operational records because the sites had different historical purposes and control environments.

3. Historical role versus current role

Topic	Historical Site B role	2015 governance posture
Animal production	Breeding / development environment supporting InGen dinosaur programs	No routine production authorized
Laboratories	Scientific and production facilities	Legacy structures; condition not assumed safe
Animal population	Managed production population that later became free-ranging after abandonment	Uncontrolled biological population; field assumptions require verification
Records	Operational and scientific production data	Incomplete legacy evidence retained for research and risk analysis
Public access	Not designed as the primary guest park	No public access

4. Evidence handling

Evidence class	Example	Use rule
A - Direct record	Signed laboratory record, system log, specimen inventory	May support factual statements within its date and scope
B - Corroborated field evidence	Independent observations agreeing on species or facility state	May support operational planning with stated uncertainty
C - Single-source field report	One observer, damaged record, or partial transmission	Use as a lead, not as a confirmed fact
D - Inference	Conclusion reconstructed from gaps in surviving records	Must be labelled as inference and kept separate from confirmed history

5. Known historical relationships

- Site B and Isla Nublar served different roles: Site B was the former breeding ground, while the original Jurassic Park visitor facility was built on Isla Nublar.
- By the events documented in 1997, Site B had been abandoned and animals were free-ranging on the island.
- Subsequent unauthorized or exceptional human activity on Isla Sorna demonstrated that legacy status did not eliminate biological risk.
- The existence of legacy animals and damaged facilities does not make Site B a substitute for the controlled research and park infrastructure on Isla Nublar.

6. 2015 decision matrix for Site B requests

Request	Default decision	Exception threshold
Retrieve historical research data	Use archived copies first	Field access only if the specific record is mission-critical and not duplicated elsewhere
Collect new biological sample	Denied by default	Executive scientific rationale plus Security and Risk approval
Inspect legacy facility	Denied by default	Required for a defined safety, legal or evidence-preservation objective
Tour / non-essential visit	Denied	No business exception
Remote observation	Preferred when technically feasible	Must still follow data-retention and biosecurity review

7. Relationship to current Jurassic World operations

Jurassic World operates on Isla Nublar, not Site B. The Masrani-era park was planned and constructed on Nublar using modern infrastructure and InGen scientific/security support. Site B should therefore be treated as a historical and biological-risk source, not as part of the ordinary Jurassic World operating estate.

8. Cross-reference

- ING-CORP-001 for current site ownership and organizational responsibilities.
- ING-GEN-118 for rules on using incomplete legacy scientific evidence.
- ING-SEC-204 for modern containment and field-response expectations.
- ING-RISK-093 for historical lessons from the original Isla Nublar incident.

Canon and official source basis

The sources below were used only to anchor canonical facts. The document text itself is newly written and synthetic.

- Amblin - The Lost World: Jurassic Park (1997): Isla Sorna / Site B is a second island where InGen facilities were abandoned and dinosaurs lived free-ranging.
- Amblin - Jurassic Park III (2001): Isla Sorna is described as InGen's former breeding ground for genetically bred dinosaurs.
- Masrani Global archived official viral material: Jurassic World construction and operations are associated with Isla Nublar under the Masrani/InGen structure.
- The evidence classes, access-approval matrix, records rules and 2015 governance posture are synthetic demo content.
