

Asset Containment & Emergency Response Standard

Internal knowledge-base artifact for demonstration use

Document ID	ING-SEC-204
Effective date	10 April 2015
Classification	Internal - Security Controlled
Document owner	InGen Security, Contingency Services
Status	Controlled reference copy

Purpose. Define minimum control expectations for containment events, safety-critical system degradation, emergency command and recovery on Isla Nublar.

Scope. Applies to InGen Security, Asset Containment Unit personnel, technical responders and Jurassic World operational liaisons.

Dataset notice: This is a fan-made, synthetic enterprise document created for a RAG portfolio demo. Canonical names, locations and major franchise events are used as factual anchors; internal controls, document IDs, process detail and management language are original synthetic content.

1. Control principles

- No single individual may disable perimeter containment, safety communications and facility access controls through one privileged action.
- Safety-critical overrides require dual authorization from two independently credentialed roles, except where immediate life safety requires a documented emergency bypass.
- Containment status must remain observable from a channel independent of the primary control workstation.
- Guest movement, animal containment and technical recovery are separate command responsibilities coordinated through incident command.
- A degraded control is treated as an incident before an animal crosses a physical boundary.

2. Incident levels

Level	Trigger examples	Initial owner	Target action
Amber	Sensor disagreement, fence segment degraded, access-control anomaly	Local supervisor	Stabilize, verify, escalate if unresolved within 10 minutes
Red	Confirmed animal outside assigned zone, loss of a critical fence segment, malicious system action	Security incident commander	Isolate zone, suspend movement, deploy containment team
Black	Multiple assets uncontrolled, compound loss of power/comms/containment, mass guest exposure	Executive incident command	Island-wide coordination, evacuation/lockdown as directed

3. Safety-critical technology controls

Control	Minimum requirement	Reason
Perimeter control	Changes affecting multiple paddocks require dual approval and tamper-evident logging	Limits the impact of a single privileged account
Backup power	Automatic transfer monitored by an independent status channel; failed transfer escalates to Red	Containment must not depend on a single power path
Privileged access	Named individual accounts; no shared administrator credentials; quarterly review	Supports attribution and least privilege
Communications	Security radio channel must remain available if the park operations network is degraded	Prevents loss of command coordination
System restart	Restart of a safety-critical platform requires a written recovery sequence and two-person confirmation	Reduces cascading failures during recovery

4. Containment response by asset class

Asset class	Examples	Primary response	Special constraint
Pack predator	Velociraptor-class assets	Close adjacent zones; deploy trained containment team; preserve pack-location telemetry	Do not assume isolated behavior when one member is located
Large apex predator	Tyrannosaurus-class assets	Clear movement corridors; harden guest shelters; maintain long-range observation	Avoid compressing the animal toward populated zones
Medium carnivore	Dilophosaurus-class assets	Local isolation and tracked search pattern	Low visibility and vegetation can defeat visual-only search
Large herbivore	Triceratops / Brachiosaurus-class assets	Route guests away; use veterinary and herd-management support	Mass and panic can create secondary injury risk
Experimental / hybrid	Restricted research assets	Treat as Red by default; use project-specific dossier	Unknown phenotype may invalidate standard assumptions

5. Incident command roles

- Security Incident Commander: containment perimeter, tactical deployment and malicious-activity assessment.
- Operations Lead: guest movement, staff accountability and resort-service coordination.
- Technical Recovery Lead: power, communications, access control and safety-critical application recovery.
- Scientific Adviser: asset-specific behavior, veterinary constraints and research-risk information.
- Corporate Risk Recorder: evidence preservation, decision log, external notification and post-incident review.

6. Post-1993 mandatory safeguards

The 1993 Jurassic Park incident demonstrated that technical access, physical containment and operational staffing can fail together. Accordingly, the following safeguards are mandatory: segregation of duties for privileged control; independent containment telemetry; explicit storm staffing plans; protected emergency communications; and tested recovery runbooks. These controls are preventive and detective. None should be represented as making a biological system fail-safe.

7. Drills and evidence

1. Run a quarterly single-zone containment drill without disrupting guest areas.
2. Run a semiannual combined power-and-communications degradation exercise.
3. Retain command logs, access-control events and system-recovery records for incident review.
4. After any Red or Black event, compare actual decisions against this standard and record approved deviations.

Canon and official source basis

The sources below were used only to anchor canonical facts. The document text itself is newly written and synthetic.

- Film canon: Jurassic Park (1993) establishes catastrophic interaction between system failure and animal containment; Jurassic World (2015) depicts a modernized park with dedicated asset containment and security functions.
- Masrani Global archived official viral material: InGen Security is headed by Vic Hoskins and supports Jurassic World with contingency, communications and protective capabilities.
- Masrani Global archived official viral material: Jurassic World was built on Isla Nublar and InGen Security protected construction teams during redevelopment.
- All incident levels, response targets, authorization rules, asset-control procedures and technical safeguards in this document are synthetic demo content.
