

Genetic Asset Development & Reproductive Risk Review

Internal knowledge-base artifact for demonstration use

Document ID	ING-GEN-118
Effective date	19 January 2015
Classification	Internal - Scientific Restricted
Document owner	Genetic Research Division, InGen Technologies
Status	Controlled reference copy

Purpose. Summarize the current genetic-asset development lifecycle and the reproductive, phenotype and handoff risks that require explicit control before an asset enters operational containment.

Scope. Applies to InGen genetic research, veterinary review, asset management and security teams receiving scientific risk information.

Dataset notice: This is a fan-made, synthetic enterprise document created for a RAG portfolio demo. Canonical names, locations and major franchise events are used as factual anchors; internal controls, document IDs, process detail and management language are original synthetic content.

1. Scientific operating context

InGen's de-extinction program began with the recovery of ancient genetic material from preserved biological samples, including fossilized amber. Incomplete sequences are reconstructed using compatible living-organism DNA and validated through iterative laboratory and developmental review. The objective is not merely viability; the operational requirement is a documented understanding of traits that may affect reproduction, behavior, health and containment.

1994 reproductive finding. Following the original Jurassic Park incident, Dr. Henry Wu participated in follow-up work on Isla Nublar. The review concluded that amphibian genetic material used during sequence completion could contribute to unplanned reproductive capability. The lesson is procedural: a population-control assumption must be verified experimentally and in the field, not inferred from intended sex assignment.

2. Development lifecycle

Stage	Required output	Stop condition
Source recovery	Chain-of-custody record and sequence-quality assessment	Sample identity or integrity cannot be established
Genome reconstruction	Gap map showing donor sequences and uncertainty	Unbounded or unexplained sequence substitution
Viability review	Developmental health and stability observations	Persistent instability or unmanageable welfare risk
Phenotype review	Observed morphology, behavior and unexpected traits	Trait profile exceeds approved research envelope
Reproductive-risk review	Evidence supporting fertility assumptions and monitoring plan	Reproductive behavior not understood
Operational handoff	Security/veterinary dossier and containment constraints	Receiving team lacks controls for identified risks

3. Genetic risk flags

Flag	Meaning	Required action
GF-01 Donor sequence	Living-organism DNA materially affects a functional region	Record donor species and associated phenotype uncertainty
GF-02 Reproductive uncertainty	Sex assignment or fertility model has not been validated under field conditions	Treat population-growth risk as open
GF-03 Behavioral novelty	Observed behavior departs from reference population expectations	Update containment dossier before transfer
GF-04 Trait interaction	Multiple engineered or reconstructed traits may interact	Cross-functional review with Security and Veterinary
GF-05 Data gap	Evidence is insufficient to support an operational claim	State uncertainty explicitly; do not convert absence of evidence into assurance

4. 2015 high-interest asset review

Project Indominus. The Indominus rex program represents a deliberately hybridized asset designed to combine characteristics beyond those found in a single recreated species. Because hybridization can produce trait interactions that are difficult to predict from component genomes alone, the project is classified GF-04 by default. Security and operations must receive behavior observations rather than relying only on genetic design intent.

Asset group	Primary risk question	Operational handoff note
Velociraptor-class	How stable are social and hunting behaviors across individuals?	Containment plan must consider coordinated group behavior
Tyrannosaurus-class	Can movement, feeding and territory assumptions be validated consistently?	Large-scale physical containment and stand-off distance required
Herbivore groups	Can stress or herd movement create secondary safety risks?	Guest and vehicle routing are part of the risk model
Indominus project	Which emergent traits are not predictable from design intent?	Project-specific containment dossier required; default Red treatment if control is degraded

5. Required statements in every asset dossier

1. What is known from direct observation.
2. What is inferred from genetics or related animals.
3. What remains unknown.
4. Which condition would invalidate the current containment assumption.
5. Which team owns monitoring after operational handoff.

6. Cross-functional handoff rule

Scientific approval is not equivalent to operational acceptance. A genetically viable asset may still be unsuitable for a given enclosure, staffing model or guest-facing environment. InGen Genetics provides the evidence and uncertainty statement; Security and Operations own acceptance of the resulting containment risk.

7. Legacy data from Site B

Historical production records from Isla Sorna (Site B) remain scientifically relevant but are incomplete and must be treated as legacy evidence. Where Site B records conflict with current direct observation, current evidence governs operational decisions and the discrepancy must be preserved rather than silently reconciled.

Canon and official source basis

The sources below were used only to anchor canonical facts. The document text itself is newly written and synthetic.

- Masrani Global archived official viral material: InGen was founded around the recovery of prehistoric life from preserved DNA; Dr. Henry Wu leads InGen scientific work.
- Masrani Global archived official viral material: follow-up work after the Jurassic Park incident identified amphibian DNA as relevant to unexpected breeding capability.
- Masrani Global archived official viral material and Jurassic World (2015): the Indominus rex was developed as a new hybrid attraction under InGen scientific leadership.
- The development stages, risk flags, acceptance rules and internal asset-review framework are synthetic demo content.
